1. Introduction

This report presents the measured HVAC component and end use activity data obtained for Portugal during the iSERV project. This particular report presents the recorded energy use information by floor area and HVAC components for each activity type within the iSERV system.

A separate report presents the energy use information by the floor area served only. The reports have been separated for reasons of size and clarity, as well as due to the more controversial nature of the initial benchmarks used for apportionment by activity, as reported in this document.

2. Overall HVAC Component and Activities Overview plus Data Summaries

This section covers the overall description of the HVAC components as given in the iSERV spreadsheets for Portugal as well as summarising the measured data from the more detailed parts of this report.

2.1 Overall HVAC Components and Activities Summary

Table 1 summarises the data collected for the HVAC Components and the iSERV Activity types available in Portugal. It can be seen that the HVAC components in this country service 61 total activity types with areas ranging in size from 23 to 141,000 m². There were an average of 1 meters available for each system analysed.

Table 1 – Overall Systems Summary for Portugal showing numbers of components and meters associated with each activity type. For the components columns, the first number shows total components associated with each activity.

2.2 Summary by Activity type of measured Electrical Power Demands

This summary section contains 47 tables, one for each activity type for which we have data, summarising the range of electrical power demands found across all the HVAC component types monitored in iSERV.

The main observations from all these tables are:

- Only 47 activities had measured data
- Of these activities only 36 had a sufficient number of metered samples to obtain reasonably accurate benchmarks from.

A summary of the average **maximum** power demand benchmarks is shown in Table 2. Values in brackets indicate the standard deviation found from this average maximum. This data can be used to estimate the likely power demand to be incurred by the HVAC component while servicing this type of activity in this country. The more detailed tables also show the annual average and minimum power demands found for this equipment. Zero figures are excluded from the minima i.e. the minima show how little power might be drawn by energised equipment.

The first column shows the section number in which these benchmarks can be found. Benchmarks in red are considered to have too few samples or too short a measurement period to be reliable.

2.3 Summary of measured annual energy use by HVAC Component type servicing a given activity

This summary section contains 7 tables, one for each activity type for which we have data, summarising the range of electrical annual energy consumption per m² found across all the HVAC sub-component types monitored in iSERV.

The main observations from all these tables are:

- Only 22 activities had measured data
- Some of the components have very high ranges, such as AHU's. On the other hand, components such as all in one systems have low ranges of energy consumption.

A summary of the measured average annual energy use benchmarks by activity type and HVAC component type is shown in Table XX. Values in brackets indicate the standard deviation found from this average. This data can be used to estimate the likely annual energy use range to be incurred by the HVAC component while servicing this type of activity in this country. The more detailed tables also show the annual maximum and minimum annual energy use ranges found for this equipment.

The first column shows the section number in which these benchmarks can be found. Benchmarks in red are considered to have too few samples or too short a measurement period to be reliable.

2.3.1 Activity types – annual energy use/m² summary by All-in-One Systems sub-components

The table shows the average and standard deviation annual energy use found from the data for all activity types for the Heat Generator sub-component type shown in each column.

These figures include directly measured energy use and energy use apportioned by initial benchmarks from metered data serving more than one component.

2.4 Summary of measured monthly energy use by HVAC Sub-component type servicing a given activity

The tables in this section provide the ranges of average and standard deviation monthly energy consumptions found in different HVAC sub-component types servicing the noted end use activity across Portugal i.e. it further subdivides the information in section 2.3.

Whilst this data has the same caveats as for the annual data in Table 5, what it does illustrate is how the consumption of each sub-component varies with the month of the year. From this information it can be seen that there are seasonable consumptions in some components, such as chillers, and also some cases where we detect very high values for months in particular, which makes possible to detect a problem in the installation. For example in the component Hot Water Primary Pumps, and for activity of Open plan offices, we can see that the highest consumption is in July and August, which is an alert to try to understand the reason why it has happened.

2.4.1.1 Activity types – monthly energy use/m² summary by Air Handling Units

This table shows the measured ranges of monthly energy use recorded for this sub-component type.

3. Detailed Data Summary and Analysis

This section examines each System in detail, along with summaries of the measured data in the first column of each table. The summaries are used in the overview section in this report.

The data is considered at the level of consumption by HVAC component using the following metrics: W/m² and Annual kWh/m² and kWh/m² by month.

The data in this section is derived directly from the HERO database and is normalised to the floor areas allocated to each HVAC component within the iSERV spreadsheet for each building.

3.1 Measured data accuracy

The actual floor areas are expected to be between -1 to +4% of the value recorded in the iSERV spreadsheet, and the maximum expected error in the read for each electricity and gas meter is ± 2% [Knight 2014]. For heat meters the expected errors are around - 10% based on studies of the actual performance of installed heat meters in Sweden [Jomni 2006] and observations of installation practice in real buildings.

The findings presented here should be read with these potential inaccuracies in mind.

3.2 Energy Consumption Section – Annual Data

This section covers the annual energy consumption figures measured for each HVAC System Component and Sub-Component type.

The following tables show the average, maximum and minimum (plus their standard deviations) measured Annual Energy Consumption in kWh/m² serviced by each sub-component. This data does not take into account the activities being serviced but serves to provide an indication of the in-use ranges of Annual Energy Consumption being found in Portugal for this HVAC component. These figures include directly measured energy use and energy use apportioned by initial benchmarks from metered data serving more than one component.

3.2.1 Air Handling Units Annual Energy Consumption by Sub-Component types

Table 7 – Overall measured annual energy use by Air Handling Units Sub-component types. Average kWh/m² in Portugal

	Extract only	Supply and extract	Supply and extract with heating and cooling variants, etc	Supply only
Average	14.26	70.36	31.69	13.15
SD Average	28.20	65.39	73.79	12.36
Average Max	14.30	74.03	31.69	13.42
SD Max	28.23	65.40	73.79	13.17
Average Min	14.21	66.92	31.69	12.91
SD Min	28.16	66.15	73.79	11.63

3.2.1.1 Conclusions for Cold Generators

- The average Annual Energy Consumption measured across all Air Handling Units sub-components ranges from 13.15 in supply only sub-component to 74.03 kWh/m² in Supply and extract.

3.2.2 All-in-One System Annual Energy Consumption by Sub-Component types

Table 8 – Overall measured annual energy use by All-in-One System Sub-component types. Average kWh/m² in Portugal

	ASHP Reverse Cycle - Cooling Optimised	WSHP Reverse Cycle - Heating Optimised
Average	54.15	36.45
SD Average	11.23	
Average Max	54.15	39.70
SD Max	11.23	
Average Min	54.15	31.64
SD Min	11.23	

3.2.2.1 Conclusions for All-in-One Systems

From the data it can be seen that:

- The average Annual Energy Consumption measured across all All-in-One sub-components ranges from 36.45 in WSHP sub-component to 54.15 kWh/m² in ASHP

3.2.3 Heat Pump Annual Energy Consumption by Sub-Component types

Table 9 – Overall measured annual energy use by Heat Pump Sub-component types. Average kWh/m² in Portugal

3.2.5 Pump Annual Energy Consumption by Sub-Component types

Table 11 – Overall measured annual energy use by Pump Sub-component types. Average kWh/m² in Portugal

	Chilled water primary pumps	Hot water primary pumps	Hot water secondary pumps
Average	15.37	53.69	63.64
SD Average	23.24	76.31	106.29
Average Max	15.67	54.26	64.01
SD Max	23.18	76.04	105.97
Average Min	15.13	53.17	63.21
SD Min	23.34	76.59	106.67

3.2.5.1 *Conclusions for Pumps*

From the data it can be seen that:

- The average Annual Energy Consumption measured across all Pump sub-components ranges from 15.37 in Chilled Water primary pumps sub-component to 63.64 kWh/m² in Hot Water secondary pumps

3.2.6 Terminal Unit Annual Energy Consumption by Sub-Component types

Table 12 – Overall measured annual energy use by Terminal Unit Sub-component types. Average kWh/m² in Portugal

	DX indoor unit	Fan Coils – 2 or 4 tubes
Average kWh/m2/year	9.39	13.57
SD Average kWh/m2/year	13.08	11.56
Average Max kWh/m2/year	9.39	13.61
SD Max kWh/m2/year	13.09	11.60
Average Min kWh/m2/year	9.38	13.50
SD Min kWh/m2/year	13.07	11.48

3.2.6.1 *Conclusions for Terminal Units*

From the data it can be seen that:

- The average Annual Energy Consumption measured across all Terminal Unit sub-components ranges from 11.56 in Fan coils sub-component to 13.08 kWh/m² in DX units
- The energy use observed for fan coils do not have into account the energy use to produce the supplied chilled or hot water to these units, so higher value for DX units was expected

3.2.7 Heat Rejection Annual Energy Consumption by Sub-Component types

Table 13 – Overall measured annual energy use by Heat Rejection Sub-component types. Average kWh/m² in Portugal

Air condensers	
Average kWh/m ² /year	5.40
SD Average kWh/m ² /year	6.09
Average Max kWh/m ² /year	5.54
SD Max kWh/m ² /year	6.26
Average Min kWh/m ² /year	5.26
SD Min kWh/m ² /year	5.92
